

Stolen Rhetoric: The Appropriation of Choice by ART Industries

subRosa

Biotech industries currently expanding globally, but especially in the U.S., have opened new frontiers for colonizing bodies--and commodifying and patenting life--at the molecular and genetic level. Gamete harvesting and freezing, In Vitro Fertilization (IVF), Intra Cytoplasmic Sperm Injection (ICSI), pre-implantation embryo screening, and genetic manipulation of embryos, are just some of the new techniques transcending previous limits of reproductive intervention that have profound repercussions for human genetic heritage. Under the guise of optimizing reproduction--and "improving" human beings--ART (Assisted Reproductive Technologies) are rapidly being naturalized in every day life. As feminist theorists have pointed out, the new biotech reproductive order has territorialized the female body as a pre-eminent laboratory and tissue mine for a lucrative medical/pharmaceutical industry (1).

The women's liberation movement of the early '70s formulated a politics of women's autonomy and control over their sexuality and reproduction that included the right to safe contraception and abortion. By the late '80s, after almost two decades of abortion wars, the politics of autonomy and liberation had been transformed into a rhetoric of "choice" typified by the slogan: "A woman's right to choose," which became identified with the pro-choice movement. Since then, the rhetoric of "choice" has become firmly associated with reproductive liberalism.

Using strategic marketing, a seductive consumer industry intent on normalizing ART in every-day life has appropriated the rhetoric of "choice" in order to appeal to a broad constituency of progressive consumers ready to produce "children of choice." Marketers of new rerogenetic technologies (Reprotech)

were quick to capture this rhetorical territory, cashing in on the expectation that it would appeal to liberal, educated, middle class consumers schooled by feminist activism to be proactive in personal health care. ART industries, principally driven by profit making motives and embodying eugenic ideologies, have recuperated the politicized rhetoric of “choice” only by concealing a deeply embedded conflict between the macro politics of rationalized reproduction in late capital and a micro politics that capitalizes on individual desires.

Despite the highly invasive and risky body processes of ART, many feminists have explicitly welcomed the development of Reprotech for its promises of an expanded range of reproductive choices for women. Others have recognized that Reprotech represents not only an ultimate form of body colonization, but that its practices and ideologies reinforce patriarchal systems of scientific and medical authority, control, and rationalization of reproduction--contradicting feminist philosophies of women’s autonomy.

Recuperation of radical feminist rhetoric and practices by liberals and conservatives alike became rampant in the abortion movement. In the ‘70s, the nationally mobilized Feminist Women’s Health Movement (FWHM) developed clinics that offered a wide array of feminist health care services to women. Most controversial were their abortion services – especially the technique of menstrual extraction pioneered by the Los Angeles Feminist Women’s Health Center. This vacuum suction procedure could be done by lay practitioners and was often used as a form of early abortion. Abortion services made feminist health clinics the target of vicious attacks from anti-abortion and right-to-life fundamentalist groups like Operation Rescue. These groups appropriated many of their confrontational direct action occupation and blockage practices, as well as their spectacular visual tactics--such as their use of the fetus--from leftist activist movements including feminism. “Pro-choice,” “anti-choice,” and “pro-life” are

rhetorics that now signify a divisive, often anti-feminist, partisanship. Diverse and bitterly contradictory feminist positions on abortion have been subsumed under the liberal rhetoric of “choice.”

Abortion became such a loaded political and cultural issue that the medical profession tried very hard to wash its hands of it as much as possible. Clearly, abortion could not be made to suit capitalist ends. No sexy consumer market of clinics and products could be developed around the “choice” of abortion. But the rhetoric was perfect for the purposes of the new infertility industry that promises to be a lucrative new flesh frontier--some have estimated the potential IVF market alone at \$40-\$50 million a year. It is time to call into question the capitalist marketing strategies of Reprotech and the imbalance of macro and micro politics masked by the stolen rhetoric of “choice.”

Models of Choice

Many feminists and bio ethicists have argued that despite their risks the new reproductive technologies represent greater reproductive choices for women (and men) – most notorious among the latter is John A. Robertson whose passionate advocacy of “procreative liberty” concludes: “There is no stopping the desire for greater control of the reproductive process. ... There is no better alternative than leaving procreative decisions to the individuals whose procreative desires are most directly involved” (2). Such arguments appeal to the deepest democratic beliefs of Americans, but they overlook the way entrepreneurial marketers and fertility services providers are exploiting the rhetoric of choice to naturalize ART. Their clinic brochures, fertility advertisements, and WEB pages pitch the many reproductive choices and techniques available to satisfy the desires of different sectors of the population – including people who are not biologically infertile. Rather than selling ART

principally as a set of biomedical procedures designed to cure or circumvent severe cases of infertility, Reprotech marketers highlight its many benefits for those who want the control made possible by scientifically managed reproduction. ART is represented as a means to realize life style choices and support career goals--key factors in reifying its use in every day life.

For example, an advertisement from the Genetics & IVF Institute offers a "large choice of fully evaluated and screened donors who are immediately accessible," and a "revolutionary technique enabling men with long-term vasectomies to father children" (3). Though never mentioning any of the risks involved, such ads imply that almost anyone (who can afford it) can "make" a baby with purchased donor eggs and/or sperm, and the use of a hired gestational womb. ART would therefore seem to be the ideal choice for people living in "non-traditional family" configurations, as this group includes single women or men, older couples, affinity groups, lesbians and gays. Thanks to entrepreneurship--although most fertility books are aimed squarely at married couples--there is a thriving niche market of reproductive choices. There seems to be a specialized clinic for almost every group; for example, there are feminist and gay sperm banks and insemination clinics, as well as those that specialize in male infertility problems, or treating older women. ART is also sold as the reproductive solution for couples or singles who have pursued career goals and postponed childbearing. Healthy people considered at risk for certain diseases, or exposed to environmental hazards at work, can choose to use ART procedures such as gamete banking *before* they are ready to reproduce as insurance against future infertility.

ART procedures promote new eugenic consciousness (4). Marketers sell IVF as a family building technology; infertile couples are encouraged to bypass adoption and instead "make" a child of their "own." IVF is a eugenic procedure because it

involves screening and selection of 'fit' gametes and embryos. The discovery of individual gene functions through sequencing of the human genome, facilitates ever increasing use of genetic screening and manipulation. Parental "choice" now encompasses so much more than whether to have children, or not. Consumers can purchase a wide selection of pre-screened and tested human gametes that come with detailed profiles of donor characteristics promising improved success and health for offspring. IVF produces excess embryos, and multiple embryos are usually inserted to ensure implantation of at least one. By using the technologies of pre-implantation embryo screening and selective reduction, parents can select precisely which embryo is to be gestated. Selective reduction--a euphemism for abortion--is justified by the (eugenic) argument that it is the necessary means by which only 'fit' embryos are selected to be carried to full term. Here the rhetoric of choice is firmly bound to an individualistic micro politics of manipulating consumer desire. (Note: we are not making an argument for or against abortion here, but wish to note how the rhetoric of choice is used to make controversial issues acceptable.)

The liberal rhetoric of "choice" has long been used in the mass media to imply that women can "have it all" no matter what the personal or social costs. Infertility discourse similarly promotes the idea that everyone has a right to choose to have a child using whatever methods s/he can afford (procreative liberty). ART can be used to tame recalcitrant bodies. The titles of infertility books clearly tell the story of the enterprise of conquering (in) fertility, for example: *Overcoming Infertility; How to Get Pregnant with the New Technology; RESOLVE Infertility; Taking Charge of Infertility*. The imperatives to "take charge" and "overcome" urge the individual woman to take control of her body--with the help of her doctors, of course. What she learns by reading further is that ART requires her to surrender her body to disciplinary medical manipulation, surveillance, and invasion. While clients are urged to shop around for clinics

with the best specialists and success rates for particular procedures, they are given virtually no tools to assess the risks associated with ART. Instead, ART brochures and books highlight the hundreds of healthy babies that have been born using IVF. The models of “choice” offered by ART promote neither anti-authoritarian social and political values, nor do they liberate women from their biology. Rather, they reify cultural values of compulsory motherhood, and represent an intensified control of women’s bodies. In this context, the notion of choice is appropriated to promote corporate economic interests rather than personal autonomy.

Reproduction and feminist Utopian Thinking

Understandably, feminist analyses or critiques of Reprotech are rarely mentioned in mainstream ART literature. Feminist responses to assisted reproduction are too complex to be summarized here. However, contradictory strands of utopian feminist thinking regarding reproduction and maternity are well illustrated by two very different texts; the first, the extraordinary feminist utopian novel *Herland* (1915) written by the prominent socialist feminist Charlotte Perkins Gilman during the height of the first wave of feminist suffrage struggle; the second, *The Dialectic of Sex* (1969) by Shulamith Firestone, a fiery socialist feminist tract that inspired women during second wave feminism.

Gilman’s *Herland* presents a country populated solely by women. Over the course of several thousand years they have created a rational, stable, peaceful, prosperous economy and social order—including voluntary eugenic reproductive practices—based on exalting the social principle of Motherhood. The grand task of Herlanders is “Making People” in every sense of the word. There is no individual ownership of children. All the women act as nurturing and social mothers to all the children, who are all girls. There is no sexual

intercourse and no “sex feeling”. To solve problems of population control each adult woman is allowed to bear only one child. When born, this child—who is engendered by the intense inner desire and preparation of the mother-to-be, becomes part of the community, not part of a nuclear family. In *Herland* women can only get pregnant because of their great desire for a child. For the good of the community, some women voluntarily defer or forgo motherhood, satisfying their desire for it by tending the communities’ babies. In *Herland* hundreds of years of rational, diligent attention to the problems of weeding out undesirable characteristics and choosing good characteristics by voluntary eugenics have paid off in a population that is strong, healthy, beautiful, and multi-talented.

Gilman was simultaneously a radical socialist feminist, and a believer in “positive eugenics.” Her writings call for women to be liberated from the biological burdens of compulsory reproduction, motherhood, and domestic work. Gilman believed in “female values” of co-operation rather than competition, sharing skills and property, and the labor of raising children. Though she welcomes technology to liberate women from backbreaking labor, in *Herland* Gilman solves the problems of fertility and reproduction with social engineering and the development of a strangely mythic reproductive biology—a kind of parthenogenesis, like that practiced by creation Goddesses. In her utopia, reproductive self-repression for the good of the community takes the place of autonomy, as the solution to overcoming the constraints of biology and sexual reproduction.

In *The Dialectic of Sex*, on the other hand, Shulamith Firestone is adamant that technology—and technology alone—will provide human mastery of matter and free women from the tyranny of biology. ...“The biological family unit has always oppressed women and children, but now, for the first time in history, technology has created real preconditions for overthrowing these oppressive

“natural” conditions, along with their cultural reinforcements”(5). Only women’s technological control of their biology will change the patriarchal balance of power. Firestone was writing in the late 60s, a time when research on reproductive technologies was developing rapidly. Astoundingly, by the mid-80s many of the reproductive techniques she anticipated were already in place. Firestone speculates that the invention of an artificial womb will solve the vexing problem that women are still the sole bearers of children; pending this, she suggests that women pay other women as surrogate mothers. Concluding her feminist socialist analysis of the biological and material causes of women’s oppression, Firestone calls for a feminist revolution based on the creation of a humanly controlled ecological balance using cybernetic feedback systems and artificial reproductive technologies. Today, though the technologically based systems she advocated are highly developed, the feminist “revolution” is bogged down in conflicted debates about the impact and consequences (for women) of the purportedly liberating new technologies. In different ways, both Gilman and Firestone pin their utopian dreams to women freeing themselves from traditional (heterosexual) and “natural” biological reproductive processes. However, neither Gilman’s eugenicist, nor Firestone’s techno-utopianism (which is also racist) are defensible, since both depend on repressive or rationalized bodily and social processes, anathema to the goals of feminist autonomy.

Individual Desire and Reproduction in Late Capital

From the mid ‘60s onward, women’s liberation, widening use of the birth control pill and availability of abortion, began to give large numbers of women the experience of separating sex from reproduction. Feminist health and abortion services supported a politics of female autonomy and helped to change women’s attitudes toward childbearing and motherhood. Books like Adrienne Rich’s *Of Woman Born*, and Nancy Chodorow’s *The Reproduction of Mothering*, provided

generative theoretical studies of female ambivalence toward societies' constructions of reproductive functions and the institution of compulsory maternity. Crucially, they questioned and challenged the assumption that the desire to bear children is a "natural" and innate one common to all women.

The following three decades saw significant changes in women's reproductive patterns and choices. Many women began to defer child-bearing to pursue higher education and careers. Many opted for single life-styles, childfree marriages, lesbian relationships (with or without children), or experimented with collective household and child sharing arrangements. The entrepreneurs of new Reprotech took advantage of these new cultural and social patterns. Deferring childbearing lowered women's fertility rates, and ART was ready to step into the breach with techniques of ovarian hormone stimulation, IVF procedures and egg donation. During this time new definitions of infertility were established by medical authorities, and "infertiles" --supporting a growing culture of infertility--demanded that it be recognized as a disease or disability whose treatment should be covered by insurance. (At present infertility treatments and ART are financed almost entirely by the private monies of mostly middle-class and affluent users, who often mortgage houses, sell stocks, or raise bank loans to pay for treatments). Fertility doctors have supported this move, for example, the American Society of Reproductive Medicine (ASRM) and RESOLVE (an infertility support group) have joined in endorsing the "FAITH" (Fair Access to Infertility Treatment and Hope) Senate Act that calls for insurance to pay for up to four IVF treatment cycles and promises "minimal impact on the cost of health insurance"(6). While such legislation may seem like a progressive move to make ART widely accessible to all economic classes, it does not acknowledge that it still won't benefit the majority of Americans who have no health insurance at all.

American commodity desire is immediate, and is fed by the belief that science can provide technological solutions for every biological problem. The still highly experimental technologies of assisted Reprotech have a low success rate, and their long-term safety and biological and genetic risks have not begun to be adequately assessed or studied. But ART is being driven by the twin engines of (manufactured) consumer desire for new technologies, and the enormous profits to be made off the infertility business. At the macro level of politics the function of reproduction in late capital is to produce compliant workers and successful consumers to serve and feed a global commodity economy. Non-rational desire and autonomy are uncontrollable and conflict with biotech's corporate imperative to colonize and patent genes, germ lines, and life processes. Rationalized and optimized methods of new eugenic reproduction are far more efficient than the random chance method of sexual intercourse, because they can be controlled under the seductive guise of offering improved human characteristics and successful offspring. Even though the success rate of ART (between 15-22.5 % of IVF cycles result in take-home babies) is still very low, its spectacle is one of scientific authority and control. The ideology and practice of new eugenic principles that is part of the macro discourse of ART has been masked by the (micro) discourse of individual choice. Many sperm banks, for example, accept only certain categories of donors – Nobel Prize winners, successful professionals, heterosexuals, non-artists, athletes--and all require extensive genetic, medical, and racial background profiling. Desirable and highly paid egg donors must be young, intelligent, college educated, from selected ethnic and racial backgrounds, healthy, good-looking, and able to pass a battery of psychological tests.

Radical Ideas and Normalized/Naturalized Process

In order to be territorialized by capital, radical ideas and processes must be normalized/naturalized in every day life, and their dangers rewritten as benefits. This is done through literature, art, and mass media representations. Religious indoctrination works this way, as does political propaganda. Science too, relies on these instruments to make it appear rational, humanistic, and necessary, rather than outlandish and threatening. In the consumer culture of late capital, public acceptance of formerly frightening or taboo scientific ideas is managed through carefully orchestrated propaganda campaigns that domesticate the previously unthinkable with promissory rhetorics of “improvement” and “choice”, and with seductively aestheticized images of scientific processes, products, and services.

The often extreme biotechnological procedures of ART have been naturalized in this way within a few short years. Starting with the birth of Louise Brown, the first IVF baby, in 1978, in Britain, the new reproductive technologies were at first sensationalized and glorified in the media, often by use of apocalyptic language, or dire warnings about the monstrous experiments scientists were conducting in their labs. These media reports played to the fears and fantasies of people worried about becoming guinea pigs in an authoritarian scheme to remake human-kind. The media revisited all the classic archetypes and eugenic myths from Frankenstein to Brave New World. The icon of the baby in the bottle—literally *in vitro*, in the glass--was updated with pictures of doctors mixing gametes in petri dishes, and hundreds of frozen embryos crammed into cryotanks (7).

ART doctors and entrepreneurs entered the battle of representation, writing their own books and launching WEB sites that present reassuring images, human interest stories, and descriptions of ART in matter-of-fact and easily assimilated ways. For example, detailed diagrams of the interior of the female pelvis and

reproductive organs are often shown with a vision machine or surgical instrument in place. These cyborgian images help to normalize the idea of technological intervention into the reproductive body. The literature is usually directed at the (white) educated, middle-class, professional couple, or career single; it is reassuringly scientific (i.e. it gives assurances that ART is cutting edge medicine, not stitching corpses together), affirmative, and upbeat. It represents ART as an exciting creative venture any couple could undertake with their doctor.

ART literature also paints a picture of how clients can integrate these processes into their everyday lives (i.e. 'our clinics open early and close late so you can come in for your tests every day'), and helps them work out payment plans. Crucially, this literature pitches its utopian and promissory rhetoric in the non-sensationalized, calmly authoritative voice of the expert: "I helped to create the United States' first pregnancy produced from a frozen embryo" (8). This approach benefits capital and reinforces scientific authority disguised as consumer advice.

Consumer persuasion also works by aestheticizing scientific processes. An iconic representation of ART that has recently been circulated widely is a colorized microphotograph of ICSI (Intra Cytoplasmic Sperm Injection), a delicately precise micro manipulation process in which a single carefully screened, washed, and capacitated sperm is inserted through the zona pellucida of a selected egg by means of a hollow glass needle. This is an image of willful creation every bit as compelling as Michaelangelo's iconic Sistine Chapel image of God creating Adam. It is simultaneously the ultimate image of scientific control and triumph, and a secular visualization of miraculous creation. Most viewers have no understanding of the precise biotechnological process this image demonstrates, but the ideological reading is clear: Technological control over life processes.

Further, it is an image of (eugenic) “choice” that brings one superior egg and one fit sperm together in a technologically mediated act of fertilization. Without needing to spell it out directly, the ICSI picture has become an unparalleled poster child for the new eugenic processes of genetic screening and manipulation. Such consumer friendly representations have been effective in helping to naturalize the often frightening and extreme processes of ART in every day life.

The abstract beauty of the aestheticized scientific ICSI image is made possible by sophisticated new visualization instruments including sonography, hysteroscopy, laparoscopy, microphotography, tunneling microscopy, PET, and MRI. After all, the breakthrough step of being able to “see” the fetus in the womb opened the way for it to become a tragic icon in the abortion battles. Both ART and abortion foreground the fetus or take-home baby, not the mother or the woman. Since the fetus icon was contested territory already claimed by anti-abortion crusaders, ART adopted the image of the radiant bio-tech baby--the child of choice--as a central icon. After all, what ART was promising was a live baby, not just an unformed fetus. (Hard statistics of ART success are measured in “take-home-babies” not pregnancies). These iconic baby pictures have helped to domesticate strange and threatening technologies that were previously unthinkable.

Conclusion: New Practices, New Rhetorics

The micro and macro politics of the public discourse of ART are unbalanced; currently the forces of market capitalism have won the field with the consumer friendly appropriated rhetoric of “choice.” Research in assisted Reprotech is still advancing rapidly, and increasingly there are contestatory interests at stake. An ever growing body of feminist cultural theory and literature, as well as new

media practices and art works play with concepts of the cyborg body and recombinations of women and machines. The '80s saw strong feminist activism, both in the U.S. and internationally (groups such as FINNRAGE), that critiqued and opposed new Reprotech using many classic activist feminist arguments and tactics. But currently there is a wide gap between academic theory and activist (radical) feminist practices in the domains of biotech and ART. (Cyber)feminist artists working with these domains must expose the ways in which the marketing of ART promotes the colonizing interests of late capital, rather than the critical goal of women's autonomy.

New developments in ART, genetics, and biotechnology, are constructing new rhetorics and practices. This places critical artists who desire to counter the recuperation of political and cultural rhetoric by a consumer economy in a quandary. On the one hand they must learn enough about the new biological science to understand its implications and risks; on the other, they must maintain a critical stance and create a non-specialist public discourse that debunks the capitalist propaganda of corporate biotech. One way to do this is through cross-disciplinary collaborations of artists, scientists, doctors, and health practitioners, in which expertise is shared to create a participatory discourse. Rather than producing aestheticized representations or objects celebrating biotech (as many artists are now doing), such collaborations involve participants in a critical and pedagogical process--an information theatre--in which they can develop informed, critical responses based on actual learning and experience.

The challenge for feminist activist/artists is to create strategies to deterritorialize biotech's control of the female body. In Women as Wombs, Janice Raymond suggests separating science from technology in order to create a new feminist science of reproduction that doesn't depend solely on risky high tech solutions (9). (This is not because of technophobia, but because it is the money to be made

off technologizing of science that attracts the interests of capitalist entrepreneurs). Such a science would recombine diverse sources of knowledge, and interdisciplinary practices, to create wholly new solutions that take into account women's differing conditions and desires--and it would be based on a criteria of what is good for women's autonomy. New feminist reproductive science would have to devise a workable distribution mechanism, perhaps based on a combination of electronic networking and performative practices. As in the autonomous method of menstrual extraction practiced by lay people (and bypassing the medical authority system), new approaches to reproductive science could enlist feminist activists as informed, non-specialist practitioners using methods that foster principles of autonomy and embodiment.

subRosa has activated a resistant cultural practice based on the goals discussed above. Initially, we have focused on aspects of ART that have largely been silenced in public discourse. We hope to disrupt the current "choice" discourse of ART; to initiate an interventionist debate and practice among diverse non-specialist audiences; and to further probe and expose biotechnologies' far-reaching repercussions for women's health and bodily autonomy worldwide. Following is a brief listing of subRosa projects to date: 1) "Does She or Doesn't She", "SmartMom", and "Vulva De/Reconstructa" expose gender differences in ART practices, and highlight the effects of high tech body invasion on women's health and bodily autonomy. 2) "Expo EmmaGenics" and "The Economies of ART" question and challenge the ways in which market forces drive the research, development and deployment of Reprotech's products and 'services' through an analysis of the economies of ART; and 3) "Sex and Gender Education in the Biotech Century" interrogates the intersecting ideologies and practices that serve to normalize and naturalize ART, exposing their historical connections to eugenics and colonial ideologies.
